

Data Cleaning and Preparation Report

The dataset contained 14 columns, 1,201 records, and 309 missing values. Data cleaning and preparation were carried out in Power Query (Microsoft Excel) to improve data quality and ensure accurate analysis. The process included converting the dataset into an Excel table, importing it into Power Query, assigning appropriate data types to each column, replacing missing values in the Coupon Code column with "NO COUPON", removing duplicate records, extracting Year and Month from the Date column, standardizing text values, validating the dataset for any remaining errors, and exporting the cleaned data back to Excel as Cleaned Data.
